

## HUMAN FORMS FOUND IN GLASS TUBES ON MARS

SEATTLE, WA (MARS) October 31, 2009 – The president of MARS announced today that his organization has found human forms in one of the glass tubes photographed by NASA on Mars.

### **Mars' Glass Tubes: A persistent mystery**

Andrew D. Basiago stated that the human forms – believed to be either humanoids or statues – were discovered by Ross Curley, chief photo-analyst for MARS, after Basiago asked Curley to magnify an image of one of the glass tubes on Mars to see if it might hold evidence of life.

The glass tubes on Mars have been a persistent mystery. Many theories have been advanced to explain what they are, including volcanic flows, silicon-based crystalline rock forms, or the exoskeletons of serpents. This find establishes that the glass tubes are built structures on Mars.

**Curley**

In making MARS' announcement, Basiago stated:

“Now we know what the glass tubes on Mars are. They are not igneous rock formations that have oozed up from beneath the Martian surface. Indeed, they are no longer even a mystery. They are glassine structures, with support ribs, built by the human civilization living primarily beneath the surface of Mars.”

Basiago speculated that the transparent tubes might provide humanoid beings living below Mars the opportunity to walk up from the Martian underground and look out onto the surface of Mars while being protected from the severe dust storms, vicious predators, and other threats on the surface of Mars.
